

General Description

The SN74LVC2G14 is a high performance dual inverter with Schmitt-Trigger inputs operating from a 1.65 to 5.5 V supply. Pin configuration and function are the same as the SN74LVC2G04, but the inputs have hysteresis and, with its Schmitt trigger function, the SN74LVC2G14 can be used as a line receiver which will receive slow input signals.

The SN74LVC2G14 is capable of transforming slowly changing input signals into sharply defined, jitter-free output signals. In addition, it has a greater noise margin than conventional inverters.

The SN74LVC2G14 has hysteresis between the positive-going and the negative-going input thresholds (typically 1V) which is determined internally by transistor ratios and is essentially insensitive to temperature and supply voltage variations.

6. C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: $I_{CC(OPR)}=C_{PD} \cdot V_{CC} \cdot f_{in} + I_{CC} \cdot C_{PD}$ is used to determine the no-load dynamic power consumption; $P_D=C_{PD} \cdot V_{CC}^2 \cdot f_{in} + I_{CC} \cdot V_{CC} \cdot Fig.$
